MSU Capstone Project

BuckProducts Shoulder Pad Flipping Device

Each one of our backpacks requires 1 set of shoulder pads. The pads are made up of two fabric panels that are sewn and then flipped and stuffed with a foam panel to create a finished piece. This is a mentally and physically tedious procedure that we deal with for every single order.

The possibility to create a device that could aid in this process would be a total game changer in the way our post sew operations are handled.

If you want to directly help a local company that sells bags around the world, please consider helping us solve this problem!
