

## Identifying and Developing Improved Spring Barley Varieties for Montana

Spring Barley is an important part of crop rotation in Montana, rotating with sugar beets, wheat and more recently pulse crops. Growers need stable markets for barley, although in recent years barley markets have been anything but stable with increased contracts one year followed by cut contracts the next. The climate is also mirroring that lack of stability, from record production in 2016 to drought and crop failure in 2017, to delayed planting and harvest in 2018 and 2019 with fall rains causing pre-harvest sprout damage, and a severe drought in 2021. The drought in 2021 caused a shortage in barley feed and hay, resulting in higher prices for both. Growers need crops that will perform in a changing environment. The MSU Spring Barley breeding program is working to address these concerns. An important goal of the MSU program is to develop barley that is suitable for new markets providing more opportunities for the growers of Montana. We are developing lines with unique malting attributes so that Montana growers can tap into the craft brewing market. Craft brewers are also interested in Montana made from **Grower to Glass**, which is feasible with the development of the Montana craft malt industry. Malt barley is an example of a value-added market for Montana, where Montanan's can benefit from all steps of the supply chain. Growers not only garner higher revenue by selling grain for malt, but some are also malting their own barley, adding value to their crop. We are breeding barley for other high value markets, including organic food barley with improved nutritional value and highly digestible forage barley for livestock feed. Breeding barley to perform in an ever-changing environment is another goal for the program. We are working to make barley more resilient to heat, drought, acid soils, untimely rains as well as several diseases and pests. The MSU Barley breeding program's primary goal is to provide varieties that will be of economic benefit to Montana Growers.

### Innovation

As plant breeders, our major innovation is the new combination of genes in the lines we release to benefit Montanan stakeholders for the reasons detailed below:

#### **1) Reduce the impact of factors limiting barley production in Montana**

**Heat and drought:** Extended grain-fill lines are reported to be drought and heat resistant, storing more starch in drought conditions than regular grain-fill lines, reducing percent protein, a quality advantage for malting barley. These lines also seem to have different root development that can provide tolerance to drought. Several of our higher yielding lines for feed and forage are stay-green.

**Acid tolerance:** Low soil pH is a limiting factor in central and eastern Montana. Barley has stunted growth under low pH conditions. We have acquired germplasm noted to be acid tolerant. The acid trials failed in 2021. We are pursuing greenhouse screening since field trials seem unreliable. Differences in root development could provide a new source of acid resistance.

**Pre-harvest Sprouting:** In 2014 and 2019 rains during harvest caused some barley to sprout, reducing quality. We are testing lines for dormancy at harvest, and speed of germination during malting. We have found these two important traits are at least somewhat under separate genetic control. If so, we can breed a line that is dormant at harvest, benefiting growers; but also germinates quickly once dormancy is broken, benefiting maltsters.

**Harvest Damage:** Although most of the barley grown in the state has a hull that tightly adheres to the kernel, varieties that are free-threshing can be grown for feed and food. In fact, free threshing barley is preferred as pig feed. However, free-threshing varieties are more sensitive to damage of the embryo during harvest, which can reduce germination when growing for seed. Genetics as well as cultural practices can help with embryo damage.

**Biotic stress:** Although biotic stress is relatively low in Montana, there are some potential threats we are anticipating in case they become a significant economic liability. New gene combinations are being created for resistance to Fusarium head blight (FHB or scab), the spot form of net blotch, bacterial leaf spot, stripe rust, root lesion nematodes and the wheat stem sawfly. We will continue these efforts in collaboration with other investigators and monitor for potential threats and solutions to include in the program. In 2021, we have found resistance to bacterial leaf streak and are pursuing the development of resistant lines.

## **2) Improve barley yield and quality to provide an economic advantage for Montana**

New gene combinations to improve yield is a constant goal because growers are paid by the amount they produce. However, quality must also be improved, and stabilized so that growers can make a sale. The MWBC was important in the establishment of the MSU Malt Quality Lab. One of the justifications for the lab is that it would provide more malt quality data points for the breeding program. These data points allow us to test malt quality in more environments allowing us to test for malt stability. They also allow us to test at an earlier generation through methodology we have established, allowing us to improve malt quality more efficiently. No other breeding program in the country is taking advantage of malt data points in this way. Providing our own malting and testing has enabled us to better understand the requirements of a high-quality malt variety. Other breeding goals include adaptation to dryland grain production, increased forage biomass, improved forage digestibility, and improved human food nutrition. We are working with a food scientist to develop new food markets for barley. The ultimate goal is to support and increase markets for barley in Montana.

## **3) Identify new genes for barley improvement**

Several graduate student projects involve identifying new genes to improve barley. The overarching goal of these projects is to better understand the genetic control over malt quality, forage quality, and drought tolerance. This understanding is directly applied to improve barley for Montana.

## **4) Improve breeding efficiency**

One impact of the genetic dissection projects described above is the identification of molecular markers for important traits. Markers can improve breeding efficiency by tracking genes that improve traits. We have used markers to track the low protein gene, a potential drought tolerant gene and a gene that reduces beer staling. Markers can be run earlier in the breeding cycle only requiring a single leaf from a plant grown in a greenhouse. We have created a breeder friendly marker platform for barley. With the establishment of our own quality facility, we now can make associations between quality traits and markers. We are currently developing breeder friendly markers for quality traits.

The MSU Barley program is innovating by adopting newer technology to help with the breeding process, including GPS guided planting, remote sensing for phenotyping, barcoded tracking throughout the breeding pipeline, marker assisted selection, and data management and analysis through a relational database. The intention of all the innovations is to increase accuracy and efficiency of improving barley for Montana.

#### Expected outcomes and impacts

We will create improved varieties for malt, feed, food and forage adapted to Montana using new genes from other breeding programs and from the World Core Germplasm. We will develop new molecular markers to improve breeding efficiency and solve problems specific to Montana growers and end-users. Montana State University Barley Breeding Program's primary mission is to develop new lines that ensure an adequate supply of high quality malting, feed, forage and food barley, providing growers and the state with important income. Our primary objective is to enhance barley competitiveness by increasing yield and yield stability and reducing risk to growers by improving quality stability. Another objective of the program is to identify, develop and utilize new traits in released varieties that will provide an economic advantage to growers or end-users. Finally by providing lines with new end-uses we hope to provide new markets for Montana Growers.

#### **Outcomes for 2021:**

- 1) Continue the now fully functional plant breeding pipeline for spring barley.
- 2) Make crosses focusing on yield, lodging, stress resistance (preharvest sprouting, heat and drought), quality (malt, feed, food and forage), resistance to pests (FHB, stripe rust).
- 3) Continue breeding for acid tolerance.
- 4) Publications on genetic dissection of roots, malt quality and forage quality are in preparation.
- 5) Continued genetic dissection of malt quality.
- 6) Utilized new marker platform created in collaboration with USDA-ARS.
- 7) Tested quality of lines early to ensure high quality is maintained in breeding pipeline

Support from the Montana Wheat and Barely Committee makes possible our goal to establish a strong, multifaceted breeding program in Montana, providing economic value to growers and end-users through the release of improved varieties.

## Crosses for Spring Barley

The crosses for spring barley in 2021 show continued efforts to improve yield and quality of malt, feed, forage and food barley. Crosses were also made to improve resistance to scab, stem rust, stripe rust, and bacterial leaf streak.

**Table 1:** Spring barley crosses since the inception of the program in 2015

	Breeding Goals	2015	2016	2017	2018	2019	2020	2021
	High yield, high quality malt and feed	90	87	29	39	9	23	36
	Heirloom malt			75	90	94	76	25

**Current and Future Release:** MT16F02902 (Cowgirl) is the newest spring barley release. Table 2 compares Cowgirl's performance to Hays, Haymaker and Lavina. Cowgirl has equal or better grain and forage yield, similar % protein and slightly better digestibility (= lower NDF and ADF) than the controls.

**Table 2: Comparison of MT16F02902 with Controls**

Trait	Variety	Mean Variety	MT16F02902	MT16F02902 % of Variety	# of locations
<b>Grain YIELD bu/ac</b>	Lavina	89.11	87.34	98	12

\*ttest indicates difference at p&lt;.05

Table 3 compares the performance of a feed line we hope to release in 2022 with Hockett and Odyssey, with MT17M02507 out yielding Hockett and equal to Odyssey across more than 20 environments.

However, the experimental lines can outperform Odyssey under limited water or high temperatures during grainfill (data not shown). This line is a daughter of Haxby and a Stay-green line. Table 4 reports 2021 Western Regional data, indicating top performance across 9 regional environments. It was also the top yielder across location in Montana in 2021 (Table 5). In Table 5 the green highlighted lines have a stay-green line as one parent. Malt Quality for dryland and irrigated is reported in Table 6.

**Table 3: Agronomic data for future feed release of a Haxby by staygreen with improved yield**

The lines are sorted by extract, which is the maltsters measure of yield. Note that many of the highest extract lines are also staygreen. The top performing lines for the most part have good quality. Although many of the stay green lines have beta glucans that are too high in irrigated environments, beta glucans as well as other quality measures are acceptable in dryland (data not shown). The 2021 Fertility trial was grown at SARC (irrigated) and WTARC(dryland). SARC is flood irrigated and all lines had elevated beta glucans (data not shown). Two of the experimental lines (1902 and 5610) had higher proteins and lower plumps under dryland that also seemed to be negatively impacted by N (Table 7). However, Buzz and MT16M02201 had stable plumps and protein in dryland and across N treatments. Note that both Buzz and MT16M02201 had good malt quality in dryland even during the drought, although the diastatic power maybe too low for adjunct malt. MT16M02201 had the highest extract in dryland (Table 7).

**Table 7: Malt Quality in a Dry Location**

The Forage Intrastate was grown in 6 locations in 2021 all dryland (Table 8). The lines are sorted by biomass production. Several lines were equal to the controls Haymaker and Lavina. The green highlighted lines have a stay-green parent, while the blue highlighted lines had a parent with improved digestibility (lower NDF and ADF). The drought compressed differences in biomass and grain yield.

Table 9 reports the performance of the most advanced food barley in 2021. Of the material close to release (MT18 H0 line) Havener yielded better over all. However, there are lines in the pipeline that may out perform Havener (e.g. MT19\_H11\_17), although these lines require more testing. Interestingly, the highest yielding purple lines still lag behind white lines. However, we are not testing against the most commonly grown purple hull-less, because it performs so poorly we have had weed issues when testing. We hope to share some purple lines with organic farmers in 2022 to see if it would be a good replacement.

**Table 9: Agronomic performance of Hull-less lines 2021 at six locations**

Although MT18H02702 tends to yield less than Havener across location, when dryland locations are compared to irrigated, MT18H02702 perform equal to Havener. We will test this line again in 2022 to determine if we should release.

ENVIRONMENT	NUMBER	YIELD (BU/AC)		PERCENT	
		MT18H02702	Havener	Difference	
DRYLAND	10	67.0	67.7	98.9	NS
IRRIGATED	8	108.5	115.7	93.8	**

## 2021 Barley, Malt & Brewing Quality Lab work summary:

### **Research:**

#### Completed analysis for the MSU breeding program:

2020 Winter – 82 Micro  
 2020 128.148 – 403 Micro  
 2020 BA Malt/Kiln – 15 Milli  
 2020 High Low Protein – 140 Micro  
 2021 Winter – 39 Micro  
 2021 Hull-less – 16 Micro  
 2021 Intrastate – 174 Micro samples  
 2021 EYT – 80 Micro samples  
 2021 F5s – 397 Pico (In progress 2021/2022)  
 2021 PYT – 185 Micro samples (In progress 2021/2022)

**Totals:**  
 1119 Micro samples  
 397 Pico samples  
 15 Milli samples

#### Collaborative Research & Publications:

- Improving nutrition and flavor of food products by sprouting and malting diverse grains: developing new products, sustainable practices, and industry standards.* – a MSU inter-departmental collaborative grant effort.
- Glycosidic Nitrile – Hartwick College: Paper submitted, pending review: *Review of Ethyl Carbamate management in distilling with specific analysis of Glycosidic Nitrile production in North American grown barley varieties.*
- Optimization of Pico Malting for improved barley breeding: Data generation complete, writing in process.

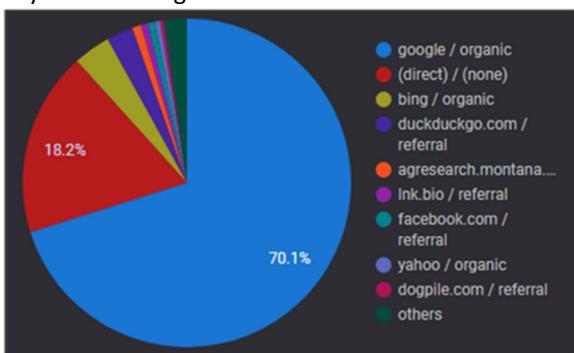

### **Education:**

Tour groups increased in 2021 with the majority being in the second half of the year, 11 in total. Tours included local maltsters, regional constituents, brewers, distillers, students and press. Over the year we maintained a position of leadership within the malting and brewing community, actively working as technical leadership for the Craft Maltster's Guild, the ASBC Malt Subcommittee, and Pink Boots. We participated in multiple live and virtual speaking events including: MT Brewers Association, Craft Maltsters Guild, MT Fresh Hop Fest, Wheat & Barley, American Craft Spirits Association, and MT Pink Boots. We also increased our website and social media impact, nearly doubling our website sessions and page views and gaining 269 follows across all social media platforms.

#### Website:

In 2020 our website had 9,132 sessions for a total of 22,245 page views.

In 2022 we will expand the field aspect of the site to include a variety tool allowing easier access to our field data.

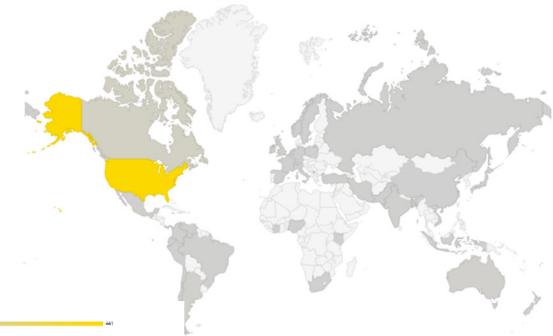

#### Social Media:

We post about what the program is working on, educational pieces, share events we participate in & more!

Instagram: 1123 followers, Facebook: 600 followers, Twitter: 44 followers, YouTube: 10 subscribers

We have  
followers  
all over the  
world!!

### **Service:**

Active clients: 50  
 107% increase of  
 Weekly testing  
 Compared to 2020.

**Third Party samples tested:**  
 Malt: 574 samples  
 Grain: 408 samples  
 Hops: 45  
 2021 Total Revenue: \$94,266

Clientele include maltsters, brewers, peer researchers, and Ag constituents. Clients are local, regional, and international including 4 countries and 25 states. In 2020 we slowed but remained stable while in 2021 we experienced a full recovery and growth of our third party testing.
