## EELE 217 Spring 2013

Assigned Tuesday, February 26, 2013
Due at the start of class on Thursday, March 7, 2013
A large, rectangular lecture room has floor dimensions 20 m wide $\times 60 \mathrm{~m}$ long, and a floor-to-ceiling height of 15 m . A balcony attached to the middle of the back wall extends 15 m into the room. The balcony is 3 m thick.

Use the following surface types to calculate estimated reverb time for this room:

- The entire main floor area is Occupied audience, orchestra, chorus.
- The top of the balcony is Upholstered seats, cloth-covered, perforated bottoms.
- The two side walls and the balcony front and underside are constructed of Wooden walls, 2 in. material.
- The ceiling is Acoustic tile on rigid surface.
- The back wall above and below the balcony is Glass, heavy plate.
- The front of the hall is Concrete block, painted.

Using the absorptivity data from the table and the Sabine equation, determine an estimate for the reverberation time ( $\mathrm{T}_{60}$ ) for the room at THREE FREQUENCIES: $125 \mathrm{~Hz}, 500 \mathrm{~Hz}$, and 4 kHz .

$$
\begin{aligned}
& T_{60}=\frac{0.161 V}{\sum_{i} S_{i} a_{i}} \\
& V=\text { total volume in } \mathrm{m}^{3} \\
& S_{i}=\text { area of surface } i \text { in }^{2} \\
& a_{i}=\text { absorptivity of surface } i
\end{aligned}
$$

Be careful to calculate the volume of the room subtracting the volume occupied by the balcony. Similarly, be careful to calculate the wall surface areas taking into account the balcony.
